2X screws

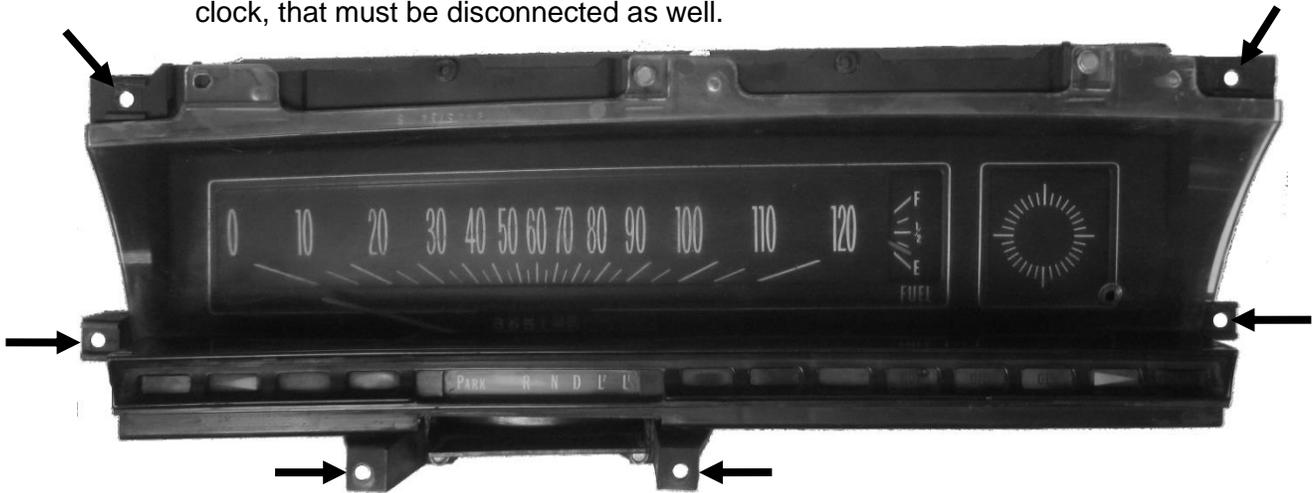

Main Harness

Control Box

Installation

1. Remove the stock gauge housing from the dash.
 - a. Remove the four screws for the lower steering column cover and remove the two nuts to drop the steering column to gain access behind the dash.
 - b. Remove the dash pad for access from the top. The entire plastic dash is riveted to the metal frame behind the dash; by removing the (6) 7/16" hex bolts you can separate the dash from the car. The locations of these bolts are: (2) on far left driver side (upper and lower), (1) by steering column support, (1) behind left side of glove box, and (2) on far right passenger side. Also remove the front speaker, emergency brake release handle, and the headlight knob (there is a push button to release it on the opposing side of the harness). For automatic transmission cars, remove the gear selector pull wire.
 - c. The stock gauge cluster is mounted to the dash in six locations; only two of the six original screws will be reused.

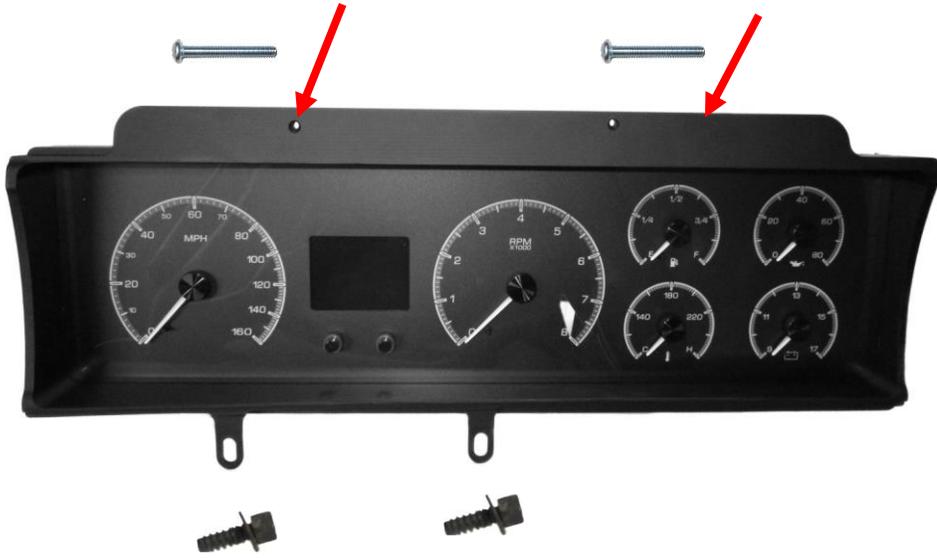

- d. You can now remove the stock cluster by disconnecting the left and right indicator harnesses, remove the speed cable and the fuel gauge harness. If equipped with a clock, that must be disconnected as well.

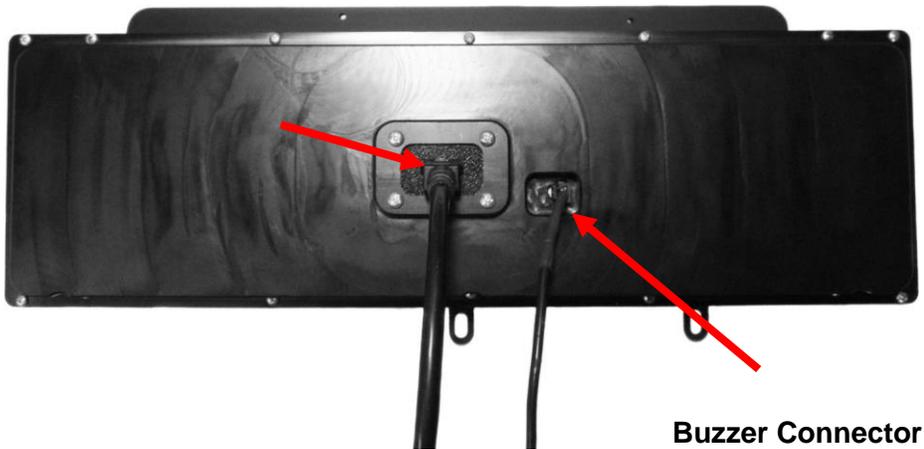

2. Place the system behind the dash from the top side. Be careful to not scratch the system on the dash frame; use tape or a rag to cover sharp areas that could damage the HDX system.

3. Mount the HDX system by sliding the provided screws through the sheet metal dash and plastic dash flange, then thread into the HDX system. Two factory screws will be used to mount the lower portion of the system

4. Connect the provided harness and the buzzer (optional for audio feedback) to the back of the HDX system.

5. Refer to the main manual for wiring instructions to complete the HDX installation.
